Institution Codes and Addresses

Most items in Mathematical Reviews (MR) and Current Mathematical Publications (CMP) include institution address codes. An institution code is used to abbreviate the address given by the author in the item (and in MR to indicate the reviewer location for some reviewers). A code consists of two [or three] parts separated by hyphens; these parts designate the country, the university or institution [and the department]. For five countries, the country designation consists of a single digit; these countries are 1- USA, 3- Canada, 4- United Kingdom, 5- Australia and 6- India. The absence of a department code indicates the Department of Mathematics. When the department is not given or has no code, the Department of Mathematics is used as the default.

The codes listed here are used for papers that appeared in the 1994 MR issues or in CMP since the 1993 Institution Codes and Addresses list was compiled; also included are all new codes created after the 1993 list was compiled. For papers reviewed before 1994, the institution codes and addresses are listed in the appropriate MR annual index. While it is not feasible to code all institutions, frequent additions are made to the list of codes. Supplements to this list appear in issues of CMP, and an updated list is planned for the MR Annual Index for 1995.

Sometimes an institution code is made invalid or is retired. Invalid codes are those which were incorrect or redundant. A cross-reference from the invalid code to the correct code will be given in the form "(Invalid; use X-XXX)". A retired code is one which was once acceptable but due to changes in the university, city or country name will not be used in the future. A cross-reference from the retired code to the new code will be given in the form "(Retired; use Y-YYY)".

TRANSLITERATION OF CYRILLIC

The system for transliteration (romanization) of Cyrillic used in this index is given below in the column headed "MR (new)". It is the system that has been used in Mathematical Reviews since the beginning of 1983 and it is largely in agreement with other transliteration systems in use in the U.S.A., such as those of the American National Standards Institute (ANSI), the U.S. Library of Congress (LC), and the Institute for Scientific Information (ISI). The principal feature of these systems is that they are intended to be as phonetic as possible for speakers of English.

The table below lists all Cyrillic letters occurring in Slavic languages, and the transliteration schemes used by:

Mathematical Reviews since 1983 = MR (new),
MR before 1983 and Zentralblatt für Mathematik (Zbl) before 1980 = old (MR, Zbl),
Zbl since 1980 = Zbl (new),
American National Standards Institute = ANSI,
U.S. Library of Congress = LC,
Institute for Scientific Information = ISI.

The transliteration of the British Standards Institute (BSI) agrees with that of ISI, except for the letters ё and й ↦ ĭ.

In the schemes of some of these enterprises, a few Cyrillic letters receive more than one transliteration, depending on the language in which the letter occurs. Non-Russian Cyrillic letters and transliterations different from the one for Russian are identified by superscript numbers:

1 Ukrainian
2 Belorussian
3 Serbian
4 Macedonian
5 Bulgarian.

In order to achieve complete reversibility of the transliteration scheme, centered dots are used as a separating or bracketing device in the following cases: тс↦t·s, тш↦t·sh, шч↦sh·ch, ыу↦y·u, ыа↦y·a, дj↦d·j, лj↦l·j, нj↦n·j, for separation, and џ↦ dzh· for bracketing.

Alphabetization (in indexes, etc.) takes place following the "stripped" version (i.e., without diacritical marks) of the transliteration; the symbol ″ (double prime) representing ъ and the single prime representing ь are treated as diacritical marks and ignored. The capital version of the Bulgarian ″ is distinguished by an underbar: ″̲.

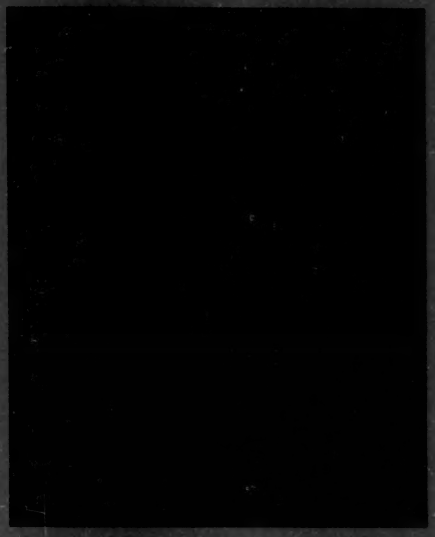
What's Happening in the Mathematical Sciences

Volume Two!



Volume 2 of *What's Happening* features the same lively writing as Volume 1, and has all new topics. Here you can read about a new class of solitons, the contributions wavelets are making to solving scientific problems, how mathematics is improving medical imaging, and Andrew Wiles's acclaimed work on Fermat's Last Theorem. *What's Happening* can be recommended to all mathematics majors, graduate students, and mathematics clubs—not to mention mathematicians who enjoy reading about recent developments in fields other than their own. *What's Happening* highlights the excitement and wonder of mathematics.
